## Low Noise Enhancement Mode Pseudomorphic HEMT in a Surface Mount Plastic Package

### Data Sheet

#### Description

Avago Technologies' ATF-58143 is a high dynamic range, low noise E-PHEMT housed in a 4-lead SC-70 (SOT-343) surface mount plastic package.

The combination of high gain, high linearity and low noise makes the ATF-58143 ideal as low noise amplifier for cellular/PCS/WCDMA base stations, wireless local loop, and other applications that require low noise and high linearity performance in the 450 MHz to 6 GHz frequency range.

identifies month of manufacture.

#### Features

- Low noise and high linearity performance
- Enhancement Mode Technology<sup>(1)</sup>
- Excellent uniformity in product specifications
- Low cost surface mount small plastic package SOT-343 (4 lead SC-70) in Tape-and-Reel packaging option available
- Lead-free option available

#### Specifications

2 GHz; 3V, 30 mA (Typ.)

- 30.5 dBm output 3<sup>rd</sup> order intercept
- 19 dBm output power at 1 dB
- 0.5 dB noise figure
- 16.5 dB associated gain

#### Applications

- Q1 LNA for cellular/PCS/WCDMA base stations
- Q1, Q2 LNA and Pre-driver amplifier for 3–4 GHz WLL
- Other low noise and high linearity applications at 450 MHz to 6 GHz

Note:

1. Enhancement mode technology requires positive Vgs, thereby eliminating the need for the negative gate voltage associated with conventional depletion mode devices.

**Attention: Observe precautions for handling electrostatic sensitive devices.**

Notes:

1. Operation of this device above any one of these parameters may cause permanent damage.
2. Assumes DC quiescent conditions.
3. Source lead temperature is 25°C. Derate 6.2 mW/°C for  $T_L > 33^\circ\text{C}$ .
4. Thermal resistance measured using 150°C Liquid Crystal Measurement method.
5. The device can handle +13 dBm RF Input Power provided  $I_{GS}$  is limited to 2 mA.  $I_{GS}$  at  $P_{1dB}$  drive level is bias circuit dependent. See applications section for additional information.

Notes:

- $F_{min}$  values at 2 GHz and higher are based on measurements while the  $F_{min}$  below 2 GHz have been extrapolated. The  $F_{min}$  values are based on a set of 16 noise figure measurements made at 16 different impedances using an ATN NP5 test system. From these measurements  $F_{min}$  is calculated. Refer to the noise parameter application section for more information.
- S and noise parameters are measured on a microstrip line made on 0.025 inch thick alumina carrier. The input reference plane is at the end of the gate lead. The output reference plane is at the end of the drain lead. The parameters include the effect of four plated through via holes connecting source landing pads on top of the test carrier to the microstrip ground plane on the bottom side of the carrier. Two 0.020 inch diameter via holes are placed within 0.010 inch from each source lead contact point, one via on each side of that point.
